

Decision Management At the Speed of Events

The power of rules, events, entities and analytics

Dan Selman, Chief Architect IBM, Operational Decision Manager,
Decision Server Insights

@danielselman

Biography

Dan Selman holds a BEng in Civil Engineering with Computing and an MSc in Artificial Intelligence.

He has been developing enterprise business rules engines for BEA Systems, ILOG and IBM since 1998.

Since 2013 he has been Chief Architect for IBM Decision Server Insights, a near real-time platform for situation detection that combines rules, Java and analytics.

Agenda

- Market context
- Decision automation
- Event-based situation detection
 - Decision Server Insights
- Analytics-driven decision automation
- Stream-based situation detection
- Big-data decision automation

Market context

We live in a moment of enormous possibility and digital transformation

90%

Of the world's data created in the last two years.

4x

Increase in key business investments in Cloud over 2013.

100%

Of LOB apps will be built for mobile-first by 2017.

75B

Devices connected to the internet by 2020.

Alone, each of these has immense potential. Together, they can **change everything.**

Customers hold more power than ever and no one is immune to these changes

2/3

Of credit card **fraud alerts** resulting in denials that are **actually legitimate** purchases

84%

Of companies believe **service is important** to their financial performance

59%

Of companies say a **customer service failure** has had a clear, **significant financial impact** on their company

Decision automation

Empowers business users to automate repeatable day-to-day business decisions and react to emerging situations in real-time

- Codify business policies, practices and regulations in natural language instead of code embedded in applications
- Empowering business people to author and change operational decisions supported by easy-to-use governance of those changes
- Automating decision making at scale, with the fidelity of an expert
- Combined business rule and business event capabilities for a comprehensive decision management platform

Transactional Decisions for
business automation

Situational Decisions to detect
situations and respond

Complete
Decision Management platform

Types of decision automation

Transactional Decisions

- Invoked in context of a business process or application (request / reply)
- Use data from transactional records
- Stateless decisions
- Interactive or batch

DECIDE

Decision Server Rules

Whatever my action,
you are ready to respond

Situational Decisions

- Triggered by multi-channel interactions (event-driven)
- Use business event history, business context and analytics
- Stateful decisions over a context built over time
- At the earliest actionable moment (real-time)

DETECT & DECIDE

Decision Server Insights

Whatever my next step,
you have anticipated my needs

Examples

Transactional Decisions

- Should this loan be approved?
- What is the appropriate discount rate that should be offered?
- What are the restrictions that apply to this sale?
- What are the documents required by the regulation?

Decision Server Rules

Situational Decisions

- When a customer enters the store, if they have made more than 5 purchases in the last 6 months, send a discount
- When a customer logs into their account from their mobile app, if they have a high churn propensity score, offer them a free month of service
- Is this transaction fraudulent given the recent history and geolocation of the customer?

Decision Server Insights

Event-driven situation detection

What...

Find patterns continuously over an event stream and correlated entity data to detect opportunities, risks or threats.

What if...

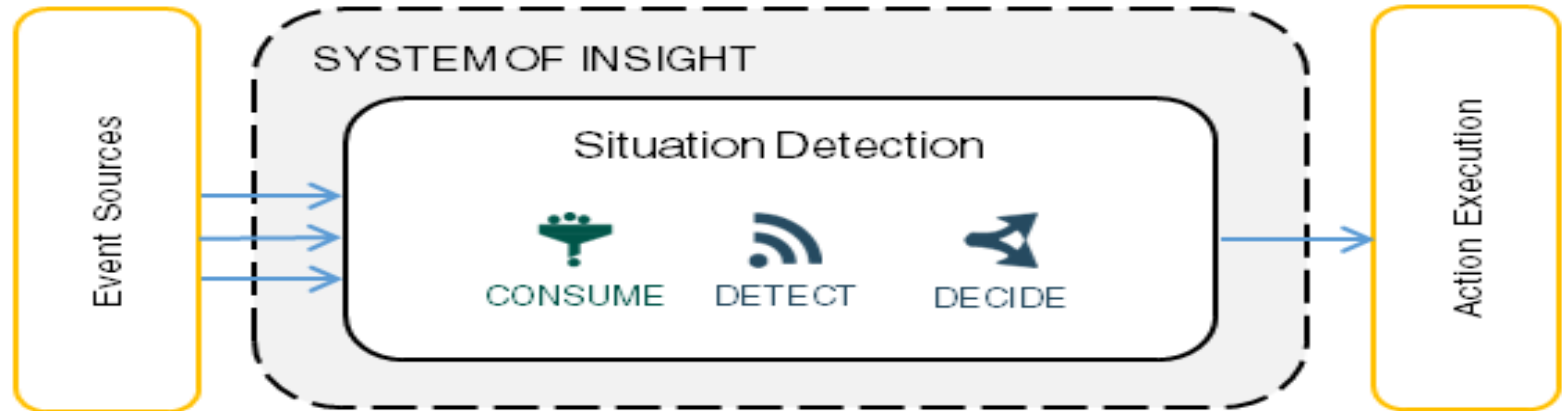

An airline could optimize the traveler experience to address change and mitigate inconvenience **on an individual basis in real-time?**

A global financial services firm could make its advisors **always-aware** of client activities and needs?

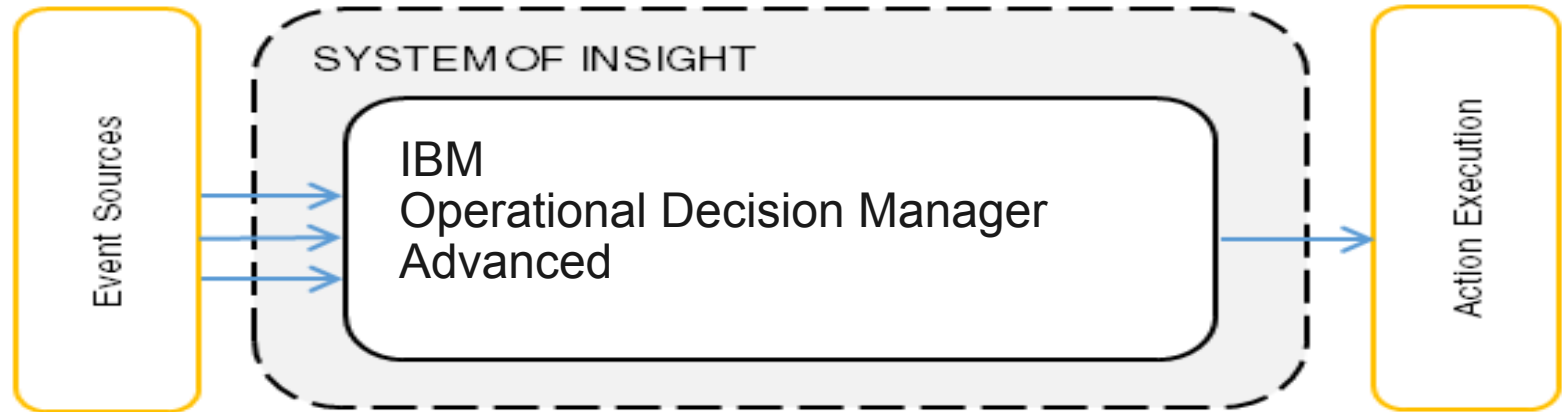

An investment bank detects when trades go wrong **decides automatically how to fix them?**

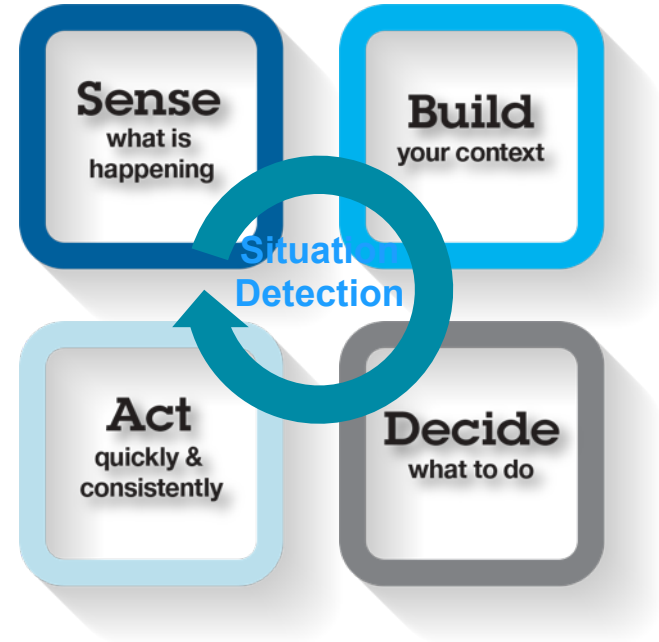

Event-driven situation detection

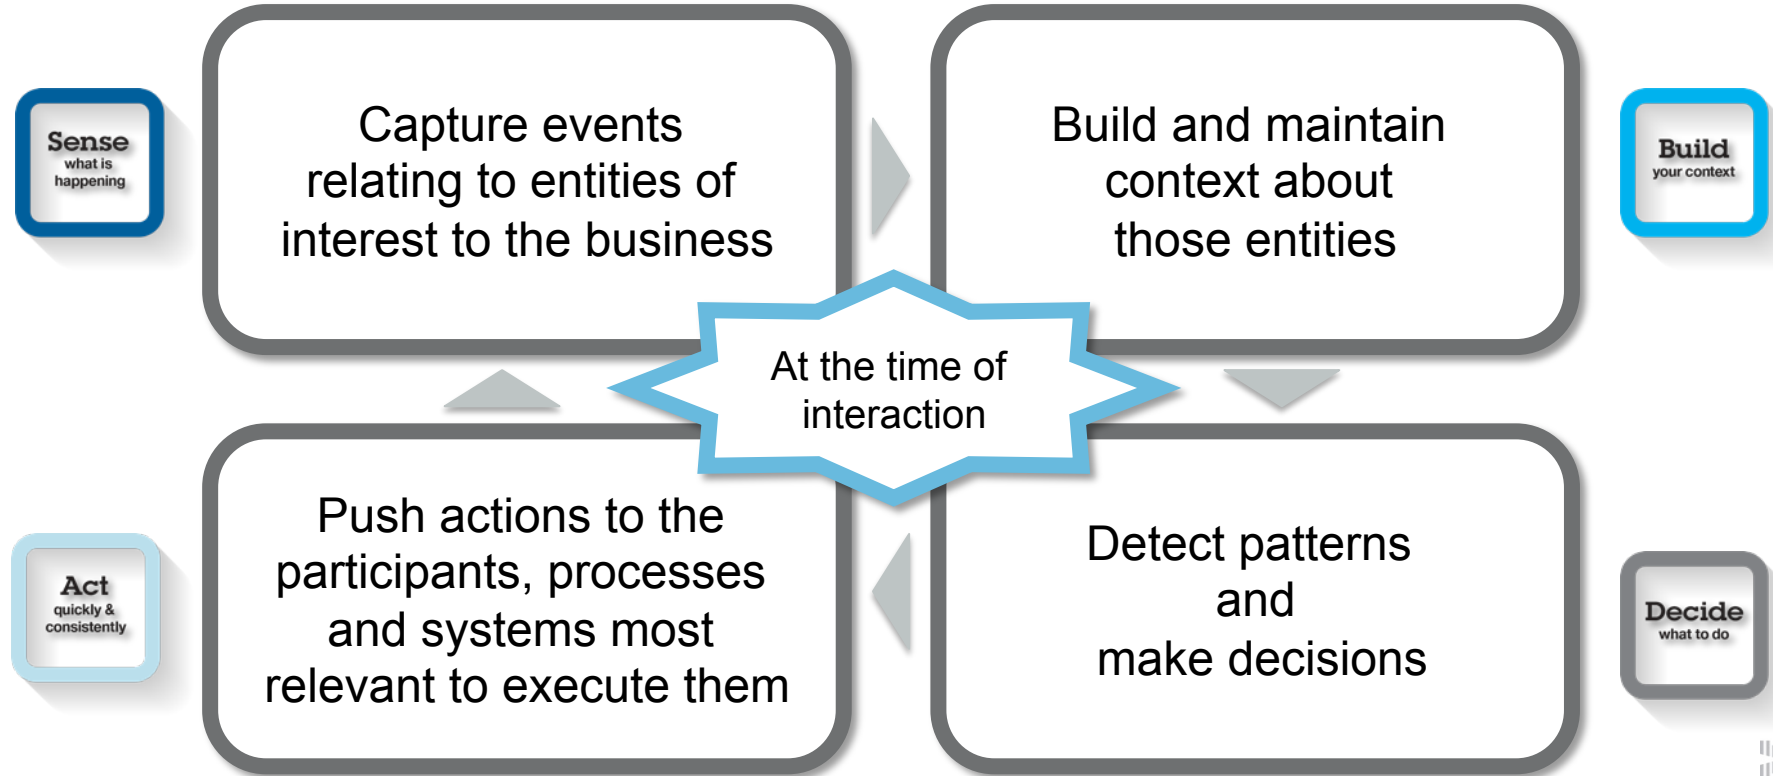

Event-driven situation detection

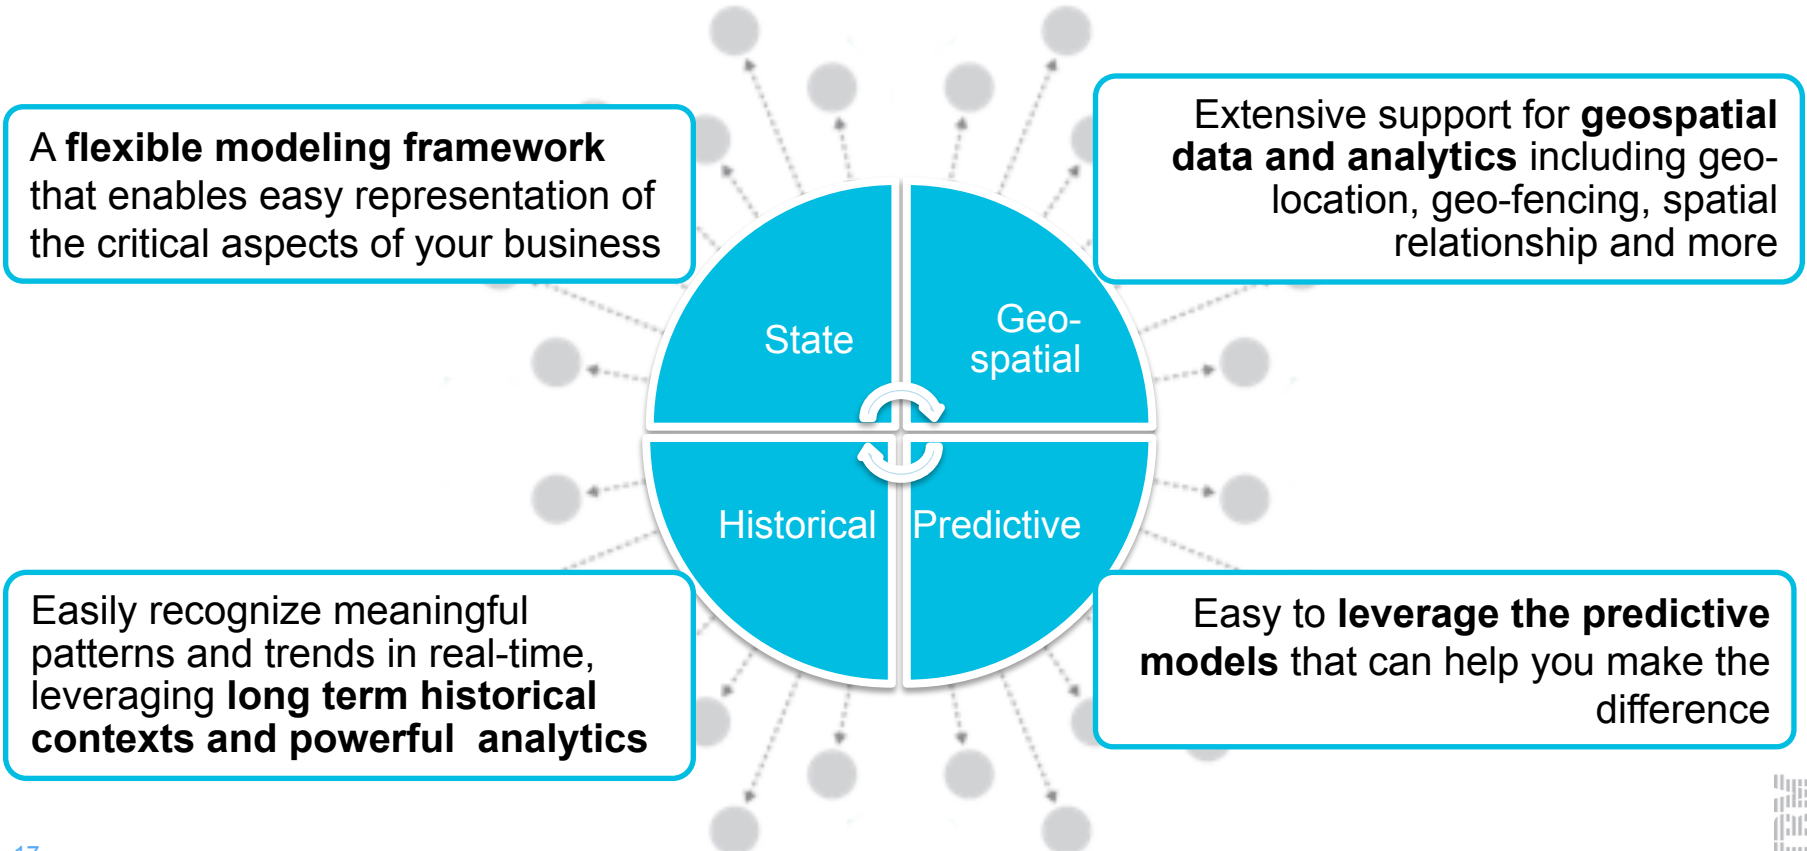

Decision making in context

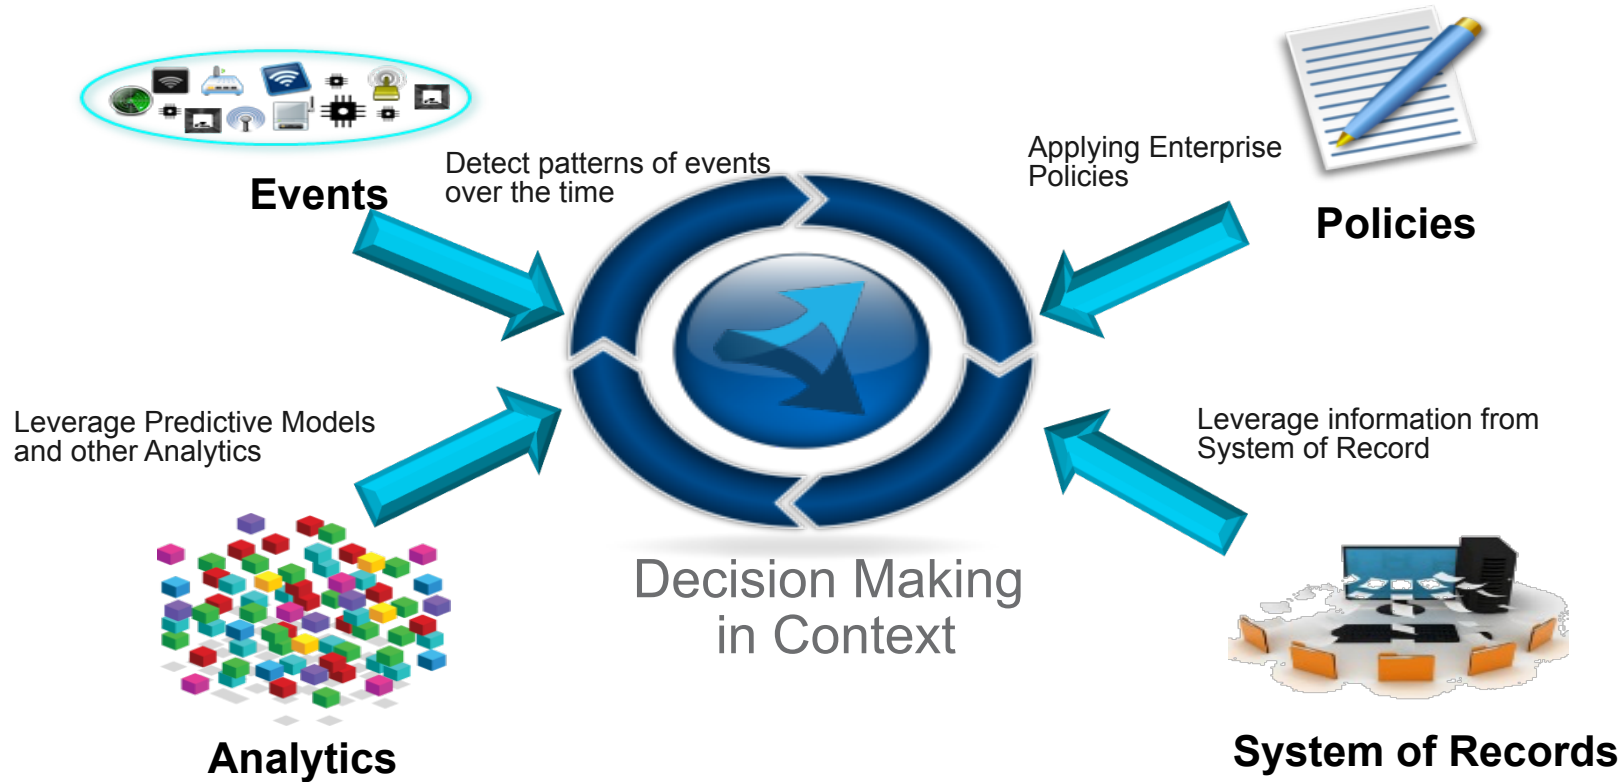

Turn insight into action to detect opportunities and identify risks

Context leads to greater understanding and enables personalized interactions

Real-time contextual decision making

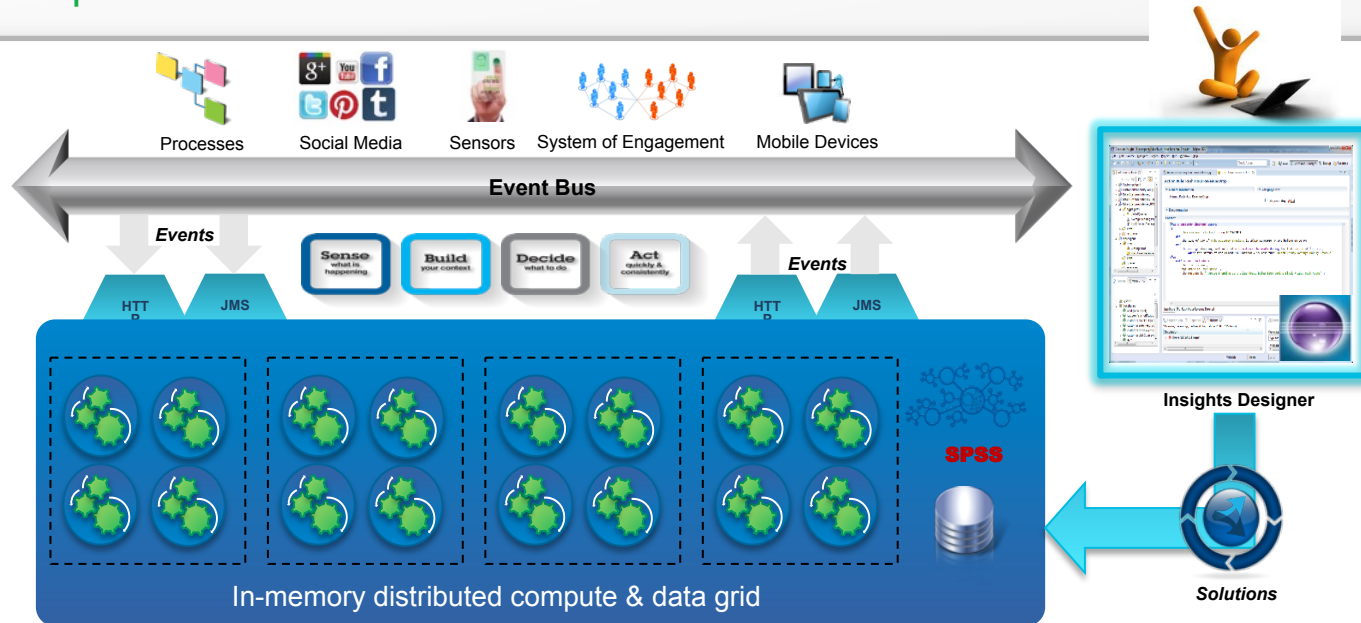

Decision Server Insights

An introduction to Decision Server Insights, part of IBM Operational Manager Advanced, which enables situational decision making for turning insights into action

Decision Server Insights at a glance

Decision Server Insights wraps **business rules, events, predictive** and **real-time analytics** in an **integrated, easy-to-operate, elastic** platform allowing continuous analysis and optimized decisions at the time of interaction leveraging **the enterprise's up-to-date analytics models and business policies**.

Insights Core Building Blocks

Event
Message representing something that happened

Entity
Some business relevant thing and related information

Agent
Business logic that is applied to an incoming event

22

Unified Business-Friendly Language

a customer is a business entity identified by a name.

a customer has a home country.

a customer has a propensity to travel.

a customer has a current location u

a country can be one of : US, France

a credit card is a business entity
named the owner.

a credit card has a credit limit (n

a card level can be one of : Standard

a transaction is a business event time-stamped by a date related to a credit card.

a transaction has an amount (numeric).

a transaction has a location that is a country.

a transaction has a geolocation used as the default geometry .

a credit card activated event is a business event time-stamped by an activation date.

a credit card activated event is related to a credit card .

a customer notification is a business event related to a customer.

a customer notification has a message.

a fraud alert is a customer notification .

a fraud alert has a fraud level.

a fraud level can be one of : Low, Medium, High.

an offer is a customer notification with an offer type.

an offer type can be one of : New Product, Discount, Reward.

Event
Message representing
something that
happened

Entity

Some business
relevant thing and
related information

Unified Business-Friendly Language

```
when a transaction occurs
  where the location is not the home country of the owner of 'the credit card'
definitions
  set 'out of country transactions' to all transactions
    where the location is not the home country of the owner of 'the credit card' ;
if
  the propensity to travel of the owner of 'the credit card' is less than 0.25
and
  there are more than 2 transactions in 'out of country transactions' during the last period of 2 days
and
  the average amount of 'out of country transactions' is more than 500
then
  emit a new fraud alert where
    the customer is the owner of 'the credit card' ,
    the fraud level is Medium ,
    the message is "Out of Country Fraudulent Use" ;
```

Analytics-driven decision automation

What...

Using analytical techniques to inform the design of automated decisions.

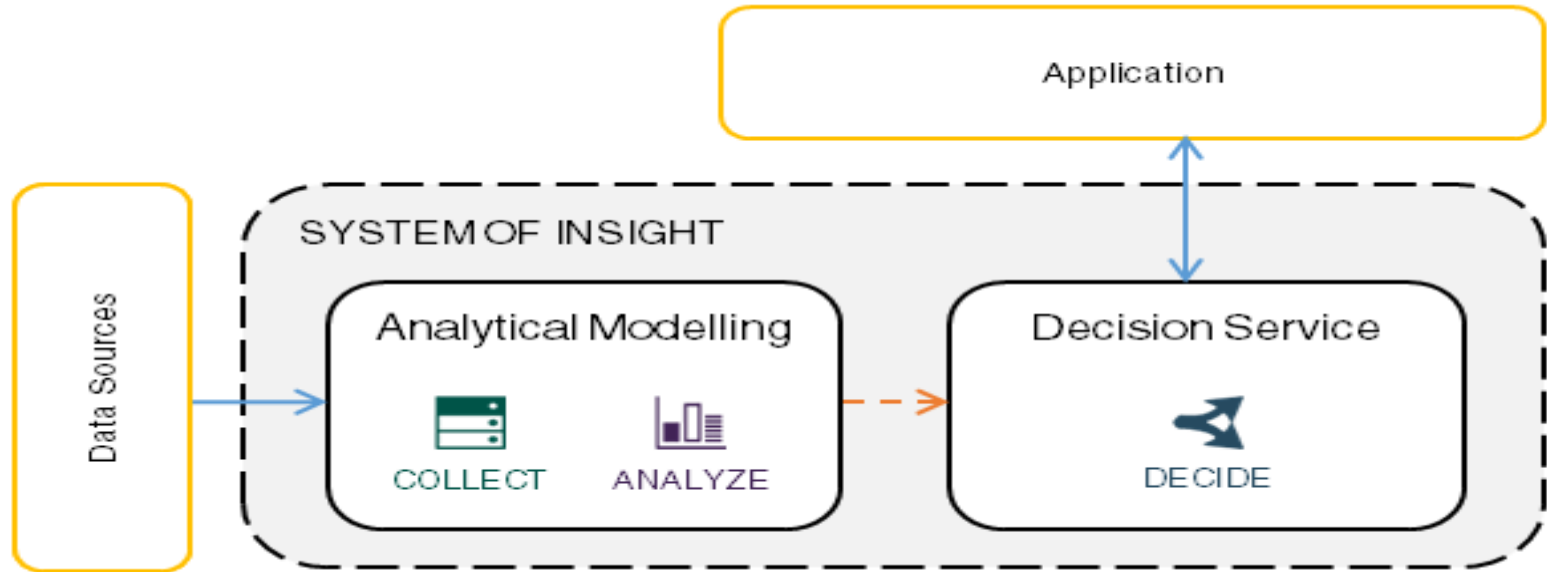

What if...

A retailer applies **segmentation analysis** to offer **tailored promotions** to their customers?

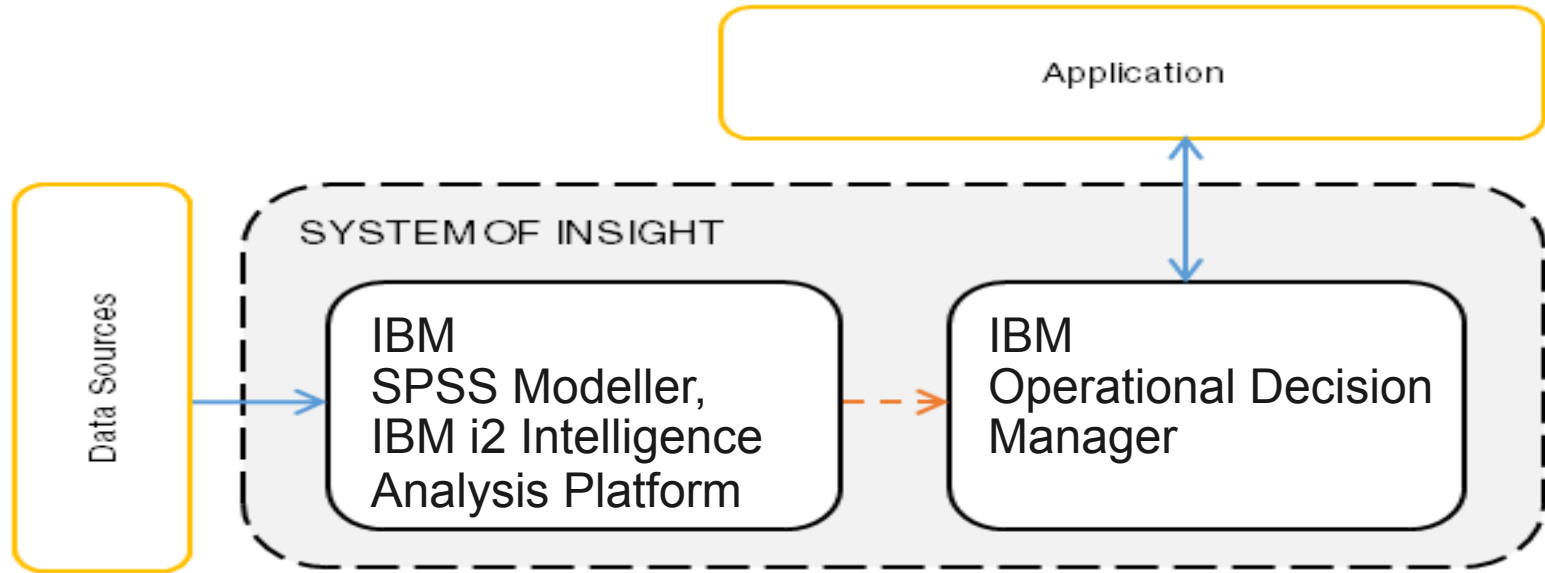

An intelligence agency **detects security risks in real-time** through analysis of passenger manifests?

Analytics-driven decision automation

Analytics-driven decision automation

Stream-based Situation Detection

What ...

Analyze data in motion providing sub millisecond response times. Structured and unstructured data sources.

What if...

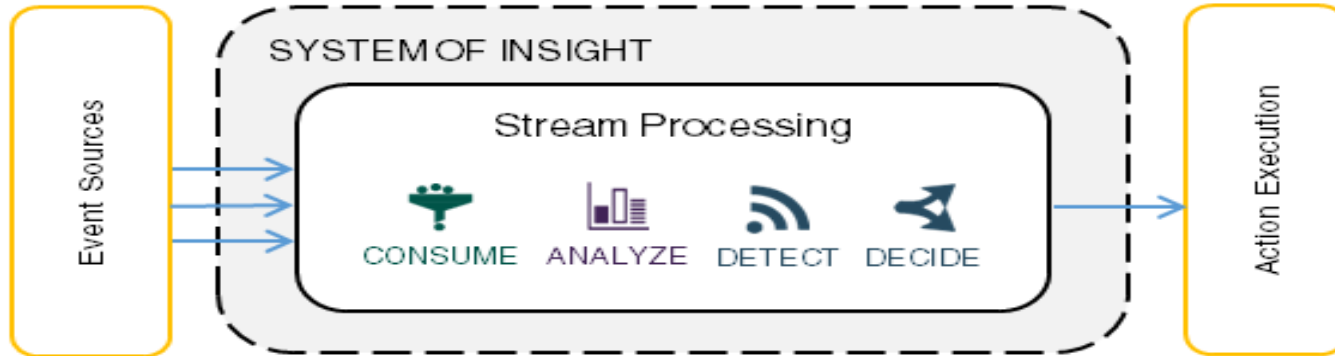

A high-street retailer use weather reports and social media streams to decide what to stock in Edinburgh?

An insurer could analyze customer and / or prospect social expressions to identify events, needs & intent?

An airport could monitor the flow of people through check-in to predict delays to flights?

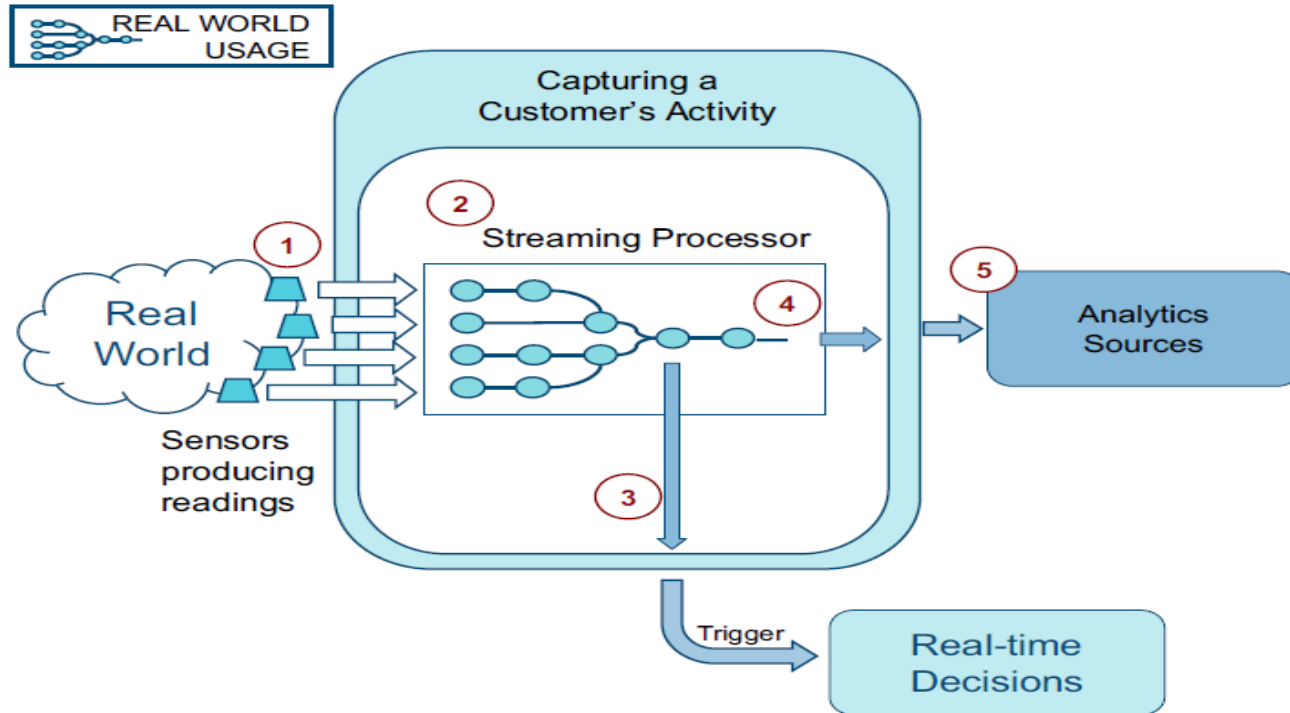

Stream-based situation detection
